Analysis of synaptic progression during barley prophase I.

C) A single bivalent extracted from the reconstruction in Figure 2B, containing an example of a ZYP1 focus present on a single AE (white box). (D) Detail of an interlock isolated from the nucleus shown in Figure 2A. For ease of interpretation, one of the bivalents has been re-coloured to show ASY1 in grey and ZYP1 in black.

<https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0039539>

Three-colour immunolabelling on meiotic prophase I (leptotene to diplotene) nuclei of wheat. CENH3 centromeric protein is visualised by a rabbit anti-CENH3 antibody and is shown in red, SC axial element protein ASY1 is visualised by a guinea pig anti-ASY1 antibody and is shown in grey and SC central element protein is visualised by a rat anti-ZYP1 antibody and is pseudo-coloured in purple. Three-dimensionally reconstructed confocal image stacks are shown in the top row while a single z stack of the image is presented in the bottom row. Images show substages of meiotic prophase I: (A) leptotene, (B) mid-zygotene, (C) pachytene, (D) diplotene. Bar = 5 μ m.

ImmunoFISH: Simultaneous Visualisation of Proteins and DNA Sequences Gives Insight Into Meiotic Processes in Nuclei of Grasses

New wheat assembly

This release of Ensembl Plants hosts the [latest wheat assembly](#) from the IWGSC (RefSeq v1.0). Current data includes:

- The IWGSC RefSeq v1.1 gene annotation.
- Alignment of 98,270 high confidence genes from the TGACv1 annotation.
- The Axiom 820K SNP Array from CerealsDB.
- EMS-induced mutations from sequenced TILLING populations (Kronos and Cadensa).
- Assembly to assembly mapping and gene ID mapping to the previous TGAC v1 assembly and annotation.
- Whole genome alignments to rice, brachypodium and barley.
- The TGACv1 assembly will still be available via the [Ensembl Plants archive site](#).

Polyploid View Enabled

Polyploid view for [wheat](#) has been enabled, allowing users to view alignments between the three wheat components [simultaneously](#).

Funding

Ensembl Plants datasets are constructed in a direct collaboration with the [Gramene](#) resource, funded by the United States [National Science Foundation award #1127112](#). Read [more about our collaboration with Gramene](#).

The development of resources for wheat is funded by the BBSRC-funded [Designing Future Wheat ISP](#).

 The previous wheat assembly ([TGACv1](#)) and every other plant from release 31 is available in the new [Ensembl Plants archive](#) site.
About *Triticum aestivum*

Triticum aestivum (bread wheat) is a major global cereal grain essential to human nutrition. Wheat was one of the first cereals to be domesticated, originating in the [fertile crescent](#) around 7000 years ago. Bread wheat is hexaploid, with a genome size estimated at ~17 Gbp, composed of three closely-related and independently maintained genomes that are the result of a series of naturally occurring hybridization events. The ancestral progenitor genomes are considered to be [Triticum urartu](#) (the A-genome donor) and an unknown grass thought to be related to *Aegilops speltoides* (the B-genome donor). This first hybridization event produced tetraploid emmer wheat (AABB, *T. dicoccoides*) which hybridized again with [Aegilops tauschii](#) (the D-genome donor) to produce modern bread wheat.

Exploring gene expression results across species under different biological conditions

Expression Atlas is an open science resource that gives users a powerful way to find information about gene and protein expression across species and biological conditions such as different tissues, cell types, developmental stages and diseases among others. Expression Atlas aims to help answering questions such as 'where is a certain gene expressed?' or 'how does its expression change in a disease?'.
